

Step 1: Create GitHub repo

1. Go to **github.com**
2. Login
3. Click + top-right
4. Click **New repository**
5. Repository name:

salon-booking-app

6. Keep it **Public** or **Private**
7. Do **NOT** tick:

Add a README

Add .gitignore

Add license

8. Click **Create repository**
-

Step 2: Open PowerShell in project folder

Run:

```
cd "C:\Users\BANUJAN\Documents\Codex\2026-04-27\i-want-to-build-a-full-2"
```

Make sure you see:

backend

frontend

Check:

dir

Step 3: Create .gitignore

Run:

notepad .gitignore

Paste:

node_modules/

.env

build/

dist/

uploads/

frontend/build/

backend/uploads/

Save and close.

Step 4: Initialize Git

Run:

```
git init
```

```
git add .
```

```
git commit -m "Initial salon booking app"
```

Step 5: Connect GitHub repo

Copy your GitHub repo URL. It looks like:

```
https://github.com/YOUR_USERNAME/salon-booking-app.git
```

Then run:

```
git branch -M main
```

```
git remote add origin https://github.com/YOUR_USERNAME/salon-booking-app.git
```

```
git push -u origin main
```

Replace YOUR_USERNAME.

When it asks login, sign in with GitHub.

You used the example URL without changing it.

This part is wrong:

```
https://github.com/YOUR_USERNAME/YOUR_REPO_NAME.git
```

You must replace it with your real GitHub repo URL.

Do this:

```
git remote remove origin
```

Then add your real repo URL, example:

```
git remote add origin https://github.com/yourgithubname/salon-booking-app.git
```

Then push:

```
git push -u origin main
```

To get the correct URL:

1. Open your GitHub repository.
2. Click the green **Code** button.
3. Copy the HTTPS URL.
4. Use that URL in:

```
git remote add origin PASTE_YOUR_REAL_URL_HERE
```

Example:

```
git remote add origin https://github.com/BANUJAN/salon-booking-app.git
```

```
git push -u origin main
```
